JAVASCRIPT | ASSIGNMENT 1

Variables, Data Types, and Console Operations

Task: Declare variables using var, let, and const to store a user's name, age, employment status, and a list of skills. Use typeof to check each variable's type and log them to the console.

CODE

```
// Assignment 1
var name = "Alice";
let age = 25;
const isEmployed = true;
const skills = ["HTML", "CSS", "JavaScript"];

console.log("Name: " + name + " (Type: " + typeof name + ")");
console.log("Age: " + age + " (Type: " + typeof age + ")");
console.log("Is Employed: " + isEmployed + " (Type: " + typeof isEmployed + ")");
console.log('Skills: ["' + skills.join('", "') + '"] (Type: ' + typeof skills + ")");
```

OUTPUT

```
Name: Alice (Type: string)
Age: 25 (Type: number)
Is Employed: true (Type: boolean)
Skills: ["HTML", "CSS", "JavaScript"] (Type: object)
```

NOTES

- var is function-scoped, let can be reassigned, and const cannot be reassigned.
- typeof returns "object" for arrays. Use Array.isArray(skills) to tell arrays from plain objects.
- skills.join(...) prints the array exactly as in the expected output.
