JAVASCRIPT | ASSIGNMENT 2

Operators, Expressions, and Input Handling

Task: Use prompt() to capture a user's bill amount and tip percentage. Perform explicit type conversion (e.g., using Number()), compute the total using arithmetic and assignment operators, and log a formatted string.

INPUT

```
Bill amount = 100, Tip percentage = 15
```

CODE

```
// Assignment 2
let billInput = prompt("Enter bill amount:", "100");
let tipInput = prompt("Enter tip percentage:", "15");

// Explicit type conversion
let subtotal = Number(billInput);
let tipPercent = Number(tipInput);

// Arithmetic and assignment operators
let tip = subtotal * tipPercent / 100;
let total = subtotal;
total += tip;

console.log("Subtotal: $" + subtotal);
console.log("Tip Percentage: " + tipPercent + "%");
console.log("Calculated Tip: $" + tip);
console.log("Total Amount to Pay: $" + total);
```

OUTPUT

```
[prompt] Enter bill amount: -> 100
[prompt] Enter tip percentage: -> 15
Subtotal: $100
Tip Percentage: 15%
Calculated Tip: $15
Total Amount to Pay: $115
```

NOTES

- prompt() always returns a string, so Number() converts the inputs before any arithmetic.
- += is the assignment operator that adds the tip to total.
- prompt() works only in a browser. The [prompt] lines in the output show the inputs being entered.
